

Dupaco Community Credit Union

Six 360s and an action centre — why one member view was not enough

A single customer view is the standard answer and it is the wrong one for a member-owned institution. A member is simultaneously an owner, a borrower, a saver, a cardholder and sometimes a business — and a staff member serving them needs whichever of those is relevant right now.

One member model underneath, six views on top — because a member relationship is not one relationship and a single screen cannot serve all of them

Situation

A community credit union of roughly \$3.6 billion in assets serving about 181,000 members across a multi-county charter, with a low-income designation and a strong community mandate.

Staff serve members across branches, contact centre and back office, and a member's relationship typically spans several product families at once.

Complication

The default design is one member 360 showing everything. In practice it shows a member's whole life on a screen and buries whatever the person in front of the staff member actually came in about.

The opposite error is a separate system per product family, which is what the institution already had.

The design

One member and household data model underneath, with six views over it — member, business, account, share, loan and card — each answering a different question and each reachable from the others.

Then an action centre above them all, so a view is not just something to read but somewhere work starts.

THE NUMBERS THAT MATTER

1

data model

6

1

action centre

3

questions per view

0

duplicated member records

1

household concept

The distinction that matters: six views is not six systems. Every view reads the same model, so nothing has to be reconciled — the difference is entirely in what each one foregrounds and what actions it offers, which is a presentation decision rather than an architectural one.

Institutional scale is publicly reported; the view model and the action-centre design come from the delivery record

PUBLICLY REPORTED

Institution context

Scale and charter figures from public credit union reporting.

- ~\$3.6bn total assets
- ~181,000 members
- Chartered 1948, Dubuque, Iowa
- Multi-county charter across three states
- Low-income designation
- Roughly twenty branch locations

DELIVERY RECORD

My ownership

Member platform delivery during the 2020–2021 engagement.

- Member and household data model
- Six 360 views over one model
- Action centre design
- Core integration for member data
- Staff workflow and routing
- Requirement through production

METHOD ILLUSTRATION

Reconstructed

The design detail shown illustrates the approach taken. Specific definitions, categories and figures are reconstructed for presentation and are not quoted from the programme record.

- Approach is from the engagement
- Detail is reconstructed to illustrate it
- Figures are directional, never measured
- Confirm specifics before citing them
- The method is what transfers
- Ask me for the underlying record

OUT OF SCOPE

Not claimed

Excluded deliberately.

- Any member or account data
- Institution financial outcomes
- Any confidential document
- Independently audited results
- Lending or credit decisions
- Commercial terms of engagement

THE SIX VIEWS

Each view answers a different question, and the question determines what is foregrounded and what actions are offered

Member 360

Who is this person to us, across everything they hold and everyone they are linked to?

Household, tenure, relationships, overall position

Business 360

What is this business entity, and how does it connect to the people behind it?

Entity, signatories, linked personal members

Account 360

What is happening on this specific deposit relationship right now?

Balances, activity, holds, alerts

Share 360

What is this member's ownership and savings position?

Share accounts, dividends, certificates

Loan 360

Where is this borrowing, and what does the member need to know about it?

Balance, schedule, delinquency, collateral

Card 360

What is happening on the card, including things the member is about to call about?

Authorisations, disputes, status, limits

Why a single view fails in a member-owned institution

A member of a credit union is an owner as well as a customer. Their relationship is genuinely multi-dimensional in a way a single-product banking customer's often is not — they hold shares, they may borrow, they carry a card, they may run a small business that also banks there, and their household is frequently part of the picture.

A single 360 either shows all of that at once, which buries the relevant part, or picks a default, which is wrong most of the time. Six purpose-built views over one model let a staff member land where the conversation actually is, and move sideways when it changes — which is what a member conversation does.

A view that only displays is a lookup — the action centre is what turns each of the six into somewhere work actually starts

What the action centre carries

- Actions available from this view for this member, filtered by what is actually permitted
- Open items already in flight — cases, applications, disputes, requests
- Prompts the institution wants surfaced, ranked rather than listed
- One-click starts that carry the member context into whatever opens next
- A record of what was done, captured once and visible from every other view

Why it belongs with the view, not beside it

- A separate task list means the staff member reads in one place and acts in another, re-establishing context each time
- Actions attached to the view inherit the member, the account and the reason for the conversation automatically
- It makes the view accountable — anything shown that cannot be acted on is a candidate for removal
- And it produces the interaction record without anyone typing one, which is the only way logging survives contact with a busy branch

The design test this produced

Every element on every view had to answer one question: what would a staff member do differently because of this?

Applied honestly, it removed a substantial amount from the initial designs. Several fields that everyone agreed were useful turned out to be useful for reporting rather than for a conversation, and belonged in the analytics layer instead. A few prompts were interesting but not actionable — nothing changed whether they were shown or not.

What survived was smaller than what was requested and considerably more used. That is the usual outcome of the test, and the reason to apply it before build rather than during the first round of adoption feedback.

Four rules for member and customer views in a community institution

- | | | |
|----|--|---|
| 01 | One model, several views | A multi-dimensional relationship needs several purpose-built views over one data model, not one view showing everything and not several systems each holding a fragment. The difference is a presentation decision, not an architectural one. |
| 02 | Let the question determine the view | Each view should answer one question and foreground what that question needs. A view that cannot be described in one question is a dashboard, and belongs in the analytics layer. |
| 03 | Put the actions where the reading happens | A separate task list forces the staff member to re-establish context. Actions attached to the view inherit the member and the reason automatically, and produce the interaction record without anyone typing one. |
| 04 | Test every element against a behaviour | What would someone do differently because this is on the screen? Applied before build it removes a great deal that everyone agreed was useful, and what survives is smaller and considerably more used. |

One member view is the standard answer. In an institution where a member is simultaneously an owner, a borrower and sometimes a business, it is the answer to a question nobody at the counter is asking.
